

New York Data Privacy & Compliance Risk Analysis (2024–2025)

Project Overview

This project analyzes reported healthcare data breach incidents in New York between 2024 and 2025 to assess trends in data privacy risk and compliance exposure.

Data Source

Publicly reported healthcare data breach records from the U.S. Department of Health & Human Services (HHS).

Methods

- Data cleaning and validation
- SQL-derived field creation (Year extraction)
- Pivot table analysis
- Descriptive trend analysis
- Data visualization

Key Findings

- Incident volume increased substantially from 2024 to 2025, driven primarily by a rise in Hacking/IT incidents.
- Unauthorized Access/Disclosure incidents remained lower in absolute count but increased in prevalence in 2025.
- Findings indicate expanding cybersecurity exposure and diversification of compliance risk vectors within New York healthcare entities.

Why This Matters

These trends highlight the need for strengthened IT security controls, enhanced compliance monitoring, and proactive risk mitigation strategies within healthcare organizations. As reported breaches increase, particularly from hacking and IT-related incidents, organizations face heightened regulatory, operational, and reputational risks. Proactive investment in strengthened IT security controls, continuous compliance monitoring, and risk mitigation strategies is essential to reducing future exposure and safeguarding sensitive patient data.
